

**Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently Amended) A ~~system~~tubular fitting ~~receivable by an opening in a work piece~~, comprising:

a structural work piece having an opening;

a tubular fitting received in the opening of the structural work piece, the fitting comprising:

a ring portion having an outer circumference and an inner circumference, the outer circumference being closely receivable by the opening in the structural work piece when the ring portion is inserted into the opening;

at least a first coupling member having at least a minimum inner circumference, an outer envelope, and an end section, the coupling member extending axially from the ring portion, the minimum inner circumference being larger than the inner circumference of the ring portion, the outer envelope sized to be moved through the opening in the work piece, and the end section configured to be engageable with another device; and

wherein the ring portion is expanded so as ~~being radially expandable where the amount of expansion is sufficient~~ to establish a secure interference fit between the outer circumference of the ring portion and the opening in the work piece.

2. (Currently Amended) The ~~tubular fitting~~system of claim 1 wherein the ring portion includes a radial flange located adjacent to the work piece when the outer circumference of the ring portion is within the opening in the work piece.

3. (Currently Amended) The ~~tubular fitting~~system of claim 1, comprising a radially opening girth groove located near the end section of the coupling member.

4. (Currently Amended) The ~~tubular fitting~~system of claim 1, comprising a second coupling member projecting axially from the ring portion and loaded on an opposing side of the work piece from the first coupling member.

5. (Canceled)

6. (Currently Amended) The ~~tubular fitting~~system of claim 4 wherein each coupling member has a radially opening girth groove.

7.-15. (Canceled)

16. (Currently Amended) A fitting for securely routing a conduit through an opening in a work piece, the fitting comprising:

a ring portion having an outer circumference and an inner circumference, the outer circumference being closely receivable by the opening in the work piece, the ring portion being radially expandable where the amount of expansion is sufficient to establish a secure interference fit between the outer circumference of the ring portion and the opening in the work piece;

a radial flange extending outwardly from the outer circumference of the ring portion, the radial flange being dimensioned so as to abut against and extend in an outward radial direction along a portion of the work piece when the ring portion is closely received by the opening in the work piece; and

at least one coupling member having at least a minimum inner circumference, an outer envelope, and an end section, the coupling member extending axially from the ring portion, the minimum inner circumference being larger than the inner circumference of the ring portion, the outer envelope sized to be moved through the opening in the work piece, ~~and the end section~~ is configured to couple with at least one other device.

17. (Canceled)

18. (Previously Presented) The fitting according to claim 16 wherein the one other device is a piece of conduit coupled with the end section of the coupling member.

19. (Currently Amended) ~~A fitting~~An assembly for bridging an opening in a work piece, the assembly comprising:

a structural member having an opening defining an inner surface;

a fitting having a ring portion and at least one coupling section, the ring portion having an outer circumference and an inner circumference, the outer circumference being closely receivable by the opening in the structural member before the ring portion is radially expanded~~work piece, the ring portion being radially expanded a expandable where the amount of expansion is sufficient amount~~ to establish a secure interference fit between the outer circumference of the ring portion and the inner surface of the opening contacting the outer circumference~~in the work piece~~, the at least one coupling section having at least a minimum inner circumference, an outer envelope, and a first portion, the coupling section extending axially from the ring portion, the minimum inner circumference being larger than the inner circumference of the ring portion, the outer envelope sized to be moved through the opening in the work piece; and;

a first member having an inner passage and a first segment, the inner passage in fluid communication with the fitting when the first segment is coupled with the first portion of the at least one coupling section.

20. (Currently Amended) A method for routing a conduit through an opening in a structural work piece, the method comprising:

inserting a first portion of a fitting into the opening in the structural work piece, the first portion of the fitting having an outer envelope sufficiently sized to be received by the opening;~~the fitting further having~~

positioning a ring portion of the fitting~~positioned~~ in the opening of the work piece, the ring portion connected with the first portion where the first portion extends axially

from the ring portion, the ring portion having an outer circumference sized to fit tightly within the opening of the work piece while the first portion extends outwardly from the work piece;

inserting a mandrel through the fitting located in the work piece, the ring portion of the fitting having an outer circumference and an inner circumference sized to be radially expandable by an increased circumference section of the mandrel, the first portion of the fitting having an inner circumference sized to be slightly larger than the increased circumference section of the mandrel; and

expanding the ring portion of the fitting in an outwardly radial direction as the mandrel is forced through the inner circumference of the ring portion such that the outer circumference of the ring portion contacts the opening so as to form an interference fit.

21. (Previously Presented) The method of claim 20, further comprising:  
cold working the material in the work piece adjacently located to the outer circumference of the ring portion of the fitting.

22. (Currently Amended) A method for routing a conduit through an opening in a work piece, the method comprising:

inserting a first portion of a fitting into the opening in the work piece, the first portion of the fitting having an outer envelope sufficiently sized to be received by the opening, the fitting further having a ring portion positioned in the opening of the work piece, the ring portion connected with the first portion where the first portion extends axially from the ring portion, the ring portion having an outer perimeter sized to fit tightly within the opening of the work piece;

passing a mandrel through the fitting located in the work piece, the ring portion of the fitting having an inner perimeter sized to be radially expandable by an increased perimeter section of the mandrel, the first portion of the fitting having an inner perimeter sized to be slightly larger than the increased perimeter section of the mandrel;

expanding the ring portion of the fitting in an outwardly radial direction as the mandrel is forced passed through the inner circumference perimeter of the ring portion; and

~~The method according to claim 20, further comprising:~~

coupling a second device with the first portion of the fitting, the second device affixed to the conduit such that the conduit is routed through the secured fitting when the second device is attached.

23. (Currently Amended) The ~~fitting~~-assembly according to claim 19 wherein the first segment is coupled with the first portion of the at least one coupling section with a clamp.

24. (Currently Amended) The ~~fitting~~-assembly according to claim 19 wherein the first segment of the first member and the first portion of the at least one coupling section are configured with grooves to receive seals.

25. (Currently Amended) The ~~fitting~~-assembly according to claim 19 wherein the minimum inner circumference of the at least one coupling section is smooth.

26. (Currently Amended) The ~~fitting~~-assembly according to claim 19 further comprising:

a radial flange coupled to the ring portion, the radial flange separated from the at least one coupling section by the ring portion.

27. (Currently Amended) The ~~fitting~~-assembly according to claim 26 wherein a thickness of the ring portion is substantially equivalent to a thickness of the work piece.

28. (New) The system of claim 1 wherein the structural work piece is a bulkhead.

29. (New) The assembly of claim 19, further comprising:

a second coupling section of the fitting, the second coupling extending axially from the ring portion such that the ring portion is interposed between the two coupling sections; and

a second member having an inner passage in fluid communication with the fitting when the second member is coupled with the second coupling section.

30. (New) The method of claim 20, further comprising:

after expanding the ring portion, coupling a conduit to the first portion of the fitting.

31. (New) The method of claim 20 wherein the structural work piece is a bulkhead of an aircraft.

32. (New) The method of claim 20 wherein the first portion extends from the structural work piece when the ring portion is positioned within the opening structural work piece.

33. (New) A method of installation, the method comprising:

inserting a first portion of a unitary fitting into an opening in a bulkhead;

moving the first portion through the opening so that at least a portion of a ring portion of the fitting is in the opening of the bulkhead and the first portion and a second portion of the fitting extend outwardly from opposite sides of the bulkhead, the ring portion being disposed between the first and second portions and having an outer circumference sized to fit tightly within the opening of the bulkhead;

inserting a mandrel through the fitting located in the bulkhead, the ring portion of the fitting having an inner circumference sized to be radially expanded by an increased circumference section of the mandrel, the first and second portions of the fitting each having an

inner circumference sized to be slightly larger than the increased circumference section of the mandrel;

expanding the ring portion of the fitting in an outwardly radial direction as the mandrel is moved through the inner circumference of the ring portion, the outer circumference of the ring portion contacting the opening so as to form an interference fit between the fitting and the bulkhead; and

after expanding the ring portion, coupling a first conduit to the first portion and a second conduit to the second portion, a passageway in the fitting extending between the first and second conduits.

34. (New) The method of claim 33 wherein a hexagonal shaped flange for engaging a wrench extends in an outwardly radial direction from the ring portion.
